Premium on the probability scale, run-bootstrap 95% CI
$\overline{\Phi}_{network} - \overline{\Phi}_{DP}$ (pp)
λ
central
closeness
eigen
random
marginal
Paired contrasts between strategies (95% CI; Δβ < 0 and Δ gap > 0: the first has the larger premium)
central - random
random - marginal
central - closeness
central - eigen
closeness - eigen
Δβ (te12)
Δ gap (pp)
λ

Cells where DP beats the network (GSS x1; fill); dot = robust DP win (one-sided max-T, familywise 5%, run bootstrap)
